MATH 3350
R Quiz 3

Instructions

- This is a take-home exam. You may use your own resources, course resources, or those found online. However, you may not interact with any other people or AI about the exam. (You should be generating your own answers.)

- You should upload the R file containing your code and the R output (as comments) with your answers. Include commented question numbers to separate your answers but otherwise you don't need to document your code. The code should be totally self-contained, so include in the code any functions that you use.

- There is typically **no partial credit**, so carefully check your work before submission. (This includes syntax for any R code that you are asked to provide.)

1. Suppose that

$$A = \begin{bmatrix} 2 & -1 & 0 & 5 \\ -3 & 4 & 4 & -7 \\ 11 & -2 & 6 & 9 \end{bmatrix} \qquad \text{and} \qquad B = \begin{bmatrix} -1 & 2 & 8 & 13 \\ 4 & 4 & 0 & 5 \\ 1 & 11 & 10 & -9 \\ 3 & 5 & -6 & -1 \end{bmatrix}$$

   (a) Find the product AB.

   (b) Find the LU factorization for B.

   (c) Find the inverse for the matrix B.

2. Suppose that in a remote town, if it rains today then there is a 50% chance of rain tomorrow. If it does not rain today, then there is an 80% of no rain tomorrow. Suppose that it does not rain on Sunday. Find the probability that it rains on the following Saturday.
